

## **Possible Risks, Hazards, or Complications**

**Discomfort:** There can be discomfort even after the topical anesthetic has been used. Anesthetics work better on some people than on others.

**Infection:** Very unusual. The areas treated must be kept clean. Only clean hands should touch the areas. Refer to the “After Care” instructions you have been provided.

**Uneven Pigmentation:** Poor healing, infection, bleeding or other causes may cause this appearance. Your follow-up appointment will likely correct any uneven appearance.

**Asymmetry:** Every effort is made to avoid asymmetry. However, our faces are not symmetrical; thus, adjustments may be needed during the follow-up session to correct any unevenness.

**Excessive Swelling or Bruising:** Some people bruise or swell more than others. Ice packs may help reduce the swelling. The swelling or bruising typically disappears in 1-5 days. Some people don't bruise or swell at all.

**Anesthetics:** Topical anesthetics are used to numb the area to be microbladed. Lidocaine, prilocaine, Benzocaine, Tetracaine, and or Epinephrine cream and or liquid are used. If you are allergic to any of these, please inform your Microblading Technician before treatment begins.

The alternative to these possibilities is to use the traditional cosmetic and NOT undergo the semi-permanent procedure.
